

Usage Scenario

Wholesale E-Commerce Website for Miskat International

The **Wholesale E-Commerce Website for Miskat International** is an automated system where the company can manage wholesale product sales and retailers can place bulk orders online. This system will help both the **management (administrator)** and **retailers/bulk buyers (users)** to interact with each other more efficiently. Retailers will be able to browse products, check wholesale prices, and place bulk orders easily through the platform.

1) Account Management

1.1) Create Account

User Perspective:

A retailer must create an account in order to access the system. To create an account, the retailer needs to provide the following information:

- Business name
- Owner name
- Mobile number
- Email address
- Business address
- Password

After providing the required information, the system will store the data in the database and create a new retailer account. Once the account is successfully created, the retailer can log into the system and start browsing wholesale products.

Admin Perspective:

The administrator account will be created by the system with a predefined username and password. The administrator will manage users, products, and orders through the admin panel.

1.2) Verification

The system will verify the user's information during registration. Only verified users will be able to access the system and place orders.

1.3) Update Account

User Perspective:

Retailers can update their profile information if needed. They can change the following information:

- Mobile number
- Email address
- Business address
- Password

After updating the information, the system will save the updated data in the database.

1.4) Password Recovery

If a user forgets their password, they can recover it using the "Forgot Password" option. Two recovery methods will be available:

Through Email:

A password reset link will be sent to the user's email. After clicking the link, the user can set a new password.

Through Mobile:

An OTP (One Time Password) will be sent to the user's mobile number. The user must enter the OTP and then create a new password.

After verification, the retailer will be able to create a new password.

1.5) Login

User Perspective:

A retailer can log into the system using the registered email address and password. The system will verify the credentials. If the information is correct, the user will be redirected to the dashboard where they can browse products and place orders.

2) Product Management

2.1) View Products

User Perspective:

After logging into the system, retailers can view the list of available products provided by Miskat International. The system will display product details such as:

- Product name
- Category
- Wholesale price
- Available stock

Retailers can browse through the product catalog to select items for purchase.

2.2) Search Products

User Perspective:

Retailers can search for specific products using the search bar. They can also filter products by category. The system will display matching results based on the user's search input.

Admin Perspective: The administrator can manage products available in the wholesale platform. The admin can:

- Add new products
- Update product details
- Delete products
- Update product price
- Manage product stock

Each product will include:

- Product name
- Category
- Price
- Minimum order quantity
- Product description

3) Order Management

3.1) Add to Cart

User Perspective:

When a retailer selects a product, they can specify the quantity and add it to the shopping cart. The system will temporarily store the selected items in the cart until the retailer confirms the order.

3.2) Place Bulk Order

User Perspective:

After selecting the desired products, the retailer can proceed to checkout. The system will display the order summary including product names, quantities, and total price. Once the retailer confirms the order, the system will record the order in the database.

Admin Perspective:

The administrator can view all orders placed by retailers. The admin can process orders and update the order status.

3.3) Order Tracking

User Perspective:

Retailers can view their previous orders and check the current order status from their dashboard. The system will display information such as order date, order items, and processing status.

4) Inventory Management

4.1) Update Product Stock

Admin Perspective:

The administrator is responsible for managing the product inventory in the system. When new products arrive or existing stock needs to be updated, the administrator logs into the admin panel and updates the product stock quantity. The administrator can increase or decrease the stock depending on the available inventory. Once the update is confirmed, the system will automatically save the new stock information in the database.

4.2) Automatic Stock Update After Order

System Perspective:

When a retailer places a bulk order through the system, the system will automatically reduce the product quantity from the available stock. This ensures that the inventory always reflects the correct number of available items. If the stock level becomes low, the administrator will be notified so that they can restock the products.

4.3) Out of Stock Notification

User Perspective:

If a retailer tries to order a product that is currently unavailable, the system will display an “**Out of Stock**” message. This helps the retailer understand that the product cannot be ordered at that moment.

Admin Perspective:

The administrator can view the list of products that are out of stock and update the inventory when new products are available.

5) Offer and Discount Management

5.1) Create Promotional Offers

Admin Perspective:

The administrator can create promotional offers or seasonal discounts for certain products. The admin selects the product and sets the discount percentage or special wholesale price. After the offer is activated, retailers will see the discounted price when browsing products on the website.

5.2) View Available Offers

User Perspective:

Retailers can view the available promotional offers when they browse products. The system will display discounted products and special deals. This helps retailers purchase products at a lower price and encourages them to place larger orders.

5.3) Apply Discount During Order

System Perspective:

When a retailer places an order for a product that has an active promotional offer, the system will automatically apply the discount to the total order price. The final payable amount will be displayed before the retailer confirms the order.

6) Payment Management**6.1) Select Payment Method****User perspective**

After confirming the order, the retailer will proceed to the payment page. The system will display the available payment options such as **Cash on Delivery, Mobile Banking (bKash/Nagad), or Bank Transfer**. The retailer selects the preferred payment method and proceeds to confirm the payment.

6.2) Payment Confirmation**System Perspective:**

Once the retailer completes the payment process, the system will verify the transaction. If the payment is successful, the system will update the order status to **“Payment Confirmed.”** The retailer will receive a confirmation message on the dashboard.

6.3) Payment Record Management**Admin Perspective:**

The administrator can view the payment details of all orders from the admin panel. The admin can check which orders are paid and which are pending. This helps the company maintain proper financial records.

7) Delivery Management**7.1) Delivery Information****User Perspective:**

During the order confirmation process, the retailer must provide delivery information such as **delivery address, contact number, and preferred delivery time**. The system will store this information to ensure the order is delivered to the correct location.

7.2) Order Processing

Admin Perspective:

After receiving an order, the administrator will review the order details and prepare the products for shipment. Once the order is processed, the administrator will update the order status to **“Processing” or “Shipped.”**

7.3) Delivery Status Update

System Perspective:

The system will allow the administrator to update the delivery status. Retailers will be able to see updates such as **Processing, Shipped, or Delivered** on their dashboard.

8) Additional Features

The proposed system will include several additional features to improve user experience and business efficiency.

- **Mobile Responsive Design:** The website will be designed to work properly on **mobile phones, tablets, and desktops**. Retailers will be able to place orders using any device.
- **Product Search and Filtering:** Retailers will be able to quickly find products using **search and category filtering options**, which will make browsing faster and easier.
- **Order Tracking System:** Retailers will be able to check the status of their orders in real time, such as:
 - ⇒ Pending
 - ⇒ Processing
 - ⇒ Shipped
 - ⇒ Delivered
- **Promotional Offers and Discounts:** The administrator will be able to create special offers, seasonal discounts, or promotional campaigns **to attract more retailers**.
- **Inventory Alert System:** The system will automatically notify the administrator **when product stock becomes low or out of stock, helping the company manage inventory more effectively**.
- **Order History:** Retailers will be able to view their previous orders and reorder products easily from their order history.
- **Security and Authentication:**

The system will ensure secure access through:

- ⇒ User authentication
- ⇒ Encrypted passwords
- ⇒ Role-based access control

This will protect sensitive business and customer information.
